**PRODUCT DESCRIPTION**

The CP10.241-M1 is a DIN rail mountable single-phase input power supply for industrial use and for use in medical equipment. It provides a stabilized and galvanically separated SELV/PELV output voltage.

The specialty of this power supply is the 2MOPP (two means of patient protection) safety approval for medical use and the fulfillment of the required EMC tests for professional healthcare facility and home healthcare environments.

The CP-Series is part of the DIMENSION power supply family. The most outstanding features of CP10.241-M1 are the high efficiency, advanced inrush current limitation, active PFC and the wide operational temperature range. The devices also offer PowerBoost: Power reserves of 20%, which may even be used continuously at temperatures up to +45°C.

High immunity to transients and power surges as well as low electromagnetic emission, a DC-OK relay contact and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

</tbody>
</table>
1. INTENDED USE

This device is designed for installation in an enclosure and is intended for use in medical equipment. Do not use this device in HF surgical equipment or similar apertures. Do not use this device in equipment, where malfunction may cause severe personal injury or threaten human life.

2. INSTALLATION INSTRUCTIONS

**WARNING**  Risk of electrical shock, fire, personal injury or death.
- Turn power off before working on the device. Protect against inadvertent re-powering.
- Do not open, modify or repair the unit.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

This device may only be installed and put into operation by qualified personnel.
This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect. If damage or malfunction should occur during installation or operation, immediately turn power off and send the device to the factory for inspection.
Install device in an enclosure providing protection against electrical, mechanical and fire hazards.
Install the device onto a DIN rail according to EN 60715 with the input terminals on the bottom of the device. Other mounting orientations require a reduction in output current.
Use shielded or unshielded cables, twisted or untwisted cables of any length. Make sure that the wiring is correct by following all local and national codes. Use appropriate copper cables that are designed for a minimum operating temperature of 90°C for ambient temperatures between +45°C and +60°C and 105°C for ambient temperatures up to +70°C. Ensure that all strands of a stranded wire enter the terminal connection.
The device is designed for pollution degree 2 areas in controlled environments. No condensation or frost is allowed.
The enclosure of the device provides a degree of protection of IP20. The enclosure does not provide protection against spilled liquids.
The isolation of the device is designed to withstand impulse voltages of overvoltage category III according to IEC 60664-1.
The device is designed as “Class of Protection I” equipment according to IEC 61140. Do not use without a proper PE (Protective Earth) connection.
The device is suitable to be supplied from TN, TT or IT mains networks. The continuous voltage between the input terminal and the PE potential must not exceed 300Vac.
The input can also be powered from batteries or similar DC sources. The continuous voltage between the supply voltage and the PE/ground potential must not exceed 375Vdc.
A disconnecting means shall be provided for the input of the device.
The device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid!
The device is designed for altitudes up to 3000m.
Keep the following minimum installation clearances: 40mm on top, 20mm on the bottom, 5mm left and right side. Increase the 5mm to 15mm in case the adjacent device is a heat source. When the device is permanently loaded with less than 50%, the 5mm can be reduced to zero.
The device is designed, tested and approved for branch circuits up to 32A (IEC) and 30A (UL) without additional protection device. If an external fuse is utilized, do not use circuit breakers smaller than 6A B- or C-Characteristic to avoid a nuisance tripping of the circuit breaker.
The maximum surrounding air temperature is +70°C. The operational temperature is the same as the ambient or surrounding air temperature and is defined 2cm below the device.

The device is designed to operate in areas between 5% and 95% relative humidity.

Portable RF communication equipment should be used no closer than 30cm to the power supply or the power supply connection cables.

**WARNING**

Use of this equipment adjacent to or stacked with other equipment should be avoided because it could result in improper operation. If such use is necessary, this equipment and the other equipment should be observed to verify that they are operating normally.
### 3. AC-INPUT

Instructions for DC use:

a) Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit.
b) Connect +pole to L and –pole to N.
c) Connect the PE terminal to an earth wire or to the machine ground.
5. **INPUT INRUSH CURRENT**

An active inrush limitation circuit (NTCs, which are bypassed by a relay contact) limits the input inrush current after turn-on of the input voltage. The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

</tbody>
</table>

*) PowerBoost
This power/ current is continuously allowed up to an ambient temperature of +45°C. Above +45°C, do not use this power/ current longer than a duty cycle of 10% and/ or not longer than 1 minute every 10 minutes.

**) HiccupPLUS Mode
At heavy overloads (when output voltage falls below 13V), the power supply delivers continuous output current for 2s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-3

***) Discharge current of output capacitors is not included.

****) This is the maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances. It is not a guaranteed value which can be achieved. The typical value is about 28.5V.

***** Reduced pulse length for AC 100V mains.

8. DC-OK Relay Contact

This feature monitors the output voltage on the output terminals of a running power supply.

| Contact closes | As soon as the output voltage reaches typ. 90% of the adjusted output voltage level. |
| Contact opens  | As soon as the output voltage dips more than 10% below the adjusted output voltage. |
|                | Short dips will be extended to a signal length of 100ms. Dips shorter than 1ms will be ignored. |
| Contact ratings| Max. 60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A resistive load |
|                | Min. 1mA at 5Vdc min. permissible load |
| Isolation voltage| See dielectric strength table in chapter 18. |

</tbody>
</table>

<sup>1)</sup> The lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor’s manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

<sup>**) MTBF stands for Mean Time Between Failure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product. The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it cannot be determined if the failed unit has been running for 50 000h or only for 100h.

11. FUNCTIONAL DIAGRAM

![Functional Diagram](image)

<sup>Aug. 2022 / Rev. 1.3 DS-CP10.241-M1-EN</sup>

All parameters are specified at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
12. TERMINALS AND WIRING

The terminals are IP20 finger safe constructed and suitable for field- and factory wiring.

Instructions:

a) Use appropriate copper cables that are designed for minimum operating temperatures of:
   90°C for ambient between 45°C and 60°C minimum
   105°C for ambient up to 70°C minimum.

b) Follow national installation codes and installation regulations!

c) Ensure that all strands of a stranded wire enter the terminal connection!

d) Do not use the unit without PE connection.

e) Unused terminal compartments should be securely tightened.

f) Ferrules are allowed.

Daisy chaining:

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the average output current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block as shown in Fig. 12-2.

Fig. 12-1 Daisy chaining of outputs

Fig. 12-2 Using distribution terminals
13. FRONT SIDE AND USER ELEMENTS

**A** Input Terminals
- Quick-connect spring-clamp terminals
  - N, L Line input
  - PE (Protective Earth) input

**B** Output Terminals
- (two identical + poles and three identical - poles)
  - Quick-connect spring-clamp terminals
    - + Positive output
    - – Negative (return) output

**C** Output voltage potentiometer
- Open the flap to adjust the output voltage. Factory set: 24.1V

**D** DC-OK LED (green)
- On, when the output voltage is >90% of the adjusted output voltage

**E** DC-OK Relay Contact
- (Push-in terminals)
- Monitors the output voltage of the running power supply.
- See chapter 8 for details.
### 14. EMC – ACCORDING TO MEDICAL STANDARDS

#### EMC Immunity

1) Double or reinforced insulation
2) After humidity preconditioning treatment
3) No classification according class B, BF and CF since the power supply is not suitable for application parts with direct patient contact.
18. PROTECTION FEATURES

Output protection      Electronically protected against overload, no-load and short-circuits
Output over-voltage protection      Typ. 30.5Vdc
                      Max. 32Vdc
                      In case of an internal power supply defect, a redundant circuit
                      limits the maximum output voltage. The output shuts down and
                      automatically attempts to restart.
Degree of protection      IP 20
Penetration protection      > 4mm
Over-temperature protection      yes
Input transient protection      MOV (Metal Oxide Varistor)
Internal input fuse      Included (1 fuse in L-line) not user replaceable
  *) In case of a protection event, audible noise may occur.

19. DIELECTRIC STRENGTH

The output voltage is floating and has no ohmic connection to the ground. Type and factory tests are conducted by the manufacturer.
Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the values in the table below.

![Fig. 19-1 Dielectric strength](image)

<table>
<thead>
<tr>
<th>Test Type</th>

## 21. REGULATORY PRODUCT COMPLIANCE

### EU Declaration of Conformity

The CE mark indicates conformance with the - EMC directive - Low-voltage directive - RoHS directive

### REACH Regulation (EU)

Manufacturer's Declaration
EU regulation regarding the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) fulfilled.

### WEEE Regulation

Manufacturer's Declaration
EU Regulation on Waste Electrical and Electronic Equipment
Registered as business to business (B2B) products.
EU Regulation 2012/19/EU
22. PHYSICAL DIMENSIONS AND WEIGHT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>39 mm</td>
</tr>
<tr>
<td>Height</td>
<td>124 mm</td>
</tr>
<tr>
<td>Depth</td>
<td>117 mm</td>
</tr>
</tbody>
</table>

The DIN rail depth must be added to the unit depth to calculate the total required installation depth.

- **Weight**: 620 g
- **DIN rail**: Use 35mm DIN rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm.
- **Housing material**: Body: Aluminium alloy, Cover: Zinc-plated steel
- **Installation clearances**: See chapter 2

---

**Fig. 22-1** Front view

**Fig. 22-2** Side view

---

Aug. 2022 / Rev. 1.3 DS-CP10.241-M1-EN

All parameters are specified at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
23. ACCESSORIES

23.1. ZM10.WALL - WALL/PANEL MOUNT BRACKET

This bracket is used to mount the devices on a wall/panel without utilizing the DIN rail. The bracket can be mounted without detaching the DIN rail brackets from the power supply. PSU for illustration purpose only.

Fig. 23-1 Isometric view

Fig. 23-2 Isometric view

Fig. 23-3 Isometric view

Fig. 23-4 Wall/panel mounting, front view

Fig. 23-5 Hole pattern for wall mounting

Fig. 23-6 Wall/panel mounting, side view
23.2. ZM12.SIDE - SIDE MOUNTING BRACKET

This bracket is used to mount the device sideways with or without utilizing a DIN rail.

The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted.

For sideways DIN rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

*) PSU for illustration purpose only.
24. APPLICATION NOTES

24.1. PEAK CURRENT CAPABILITY

The unit can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents. This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of over-current to open in a timely manner. This avoids voltage loss in adjacent circuits.

The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the power supply. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 24-1  Peak load with 2x the nominal current for 50ms, typ.

<table>
<thead>
<tr>
<th>Output Voltage</th>
<th>24V</th>
<th>17V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Current</td>
<td>20A</td>
<td>0A</td>
</tr>
</tbody>
</table>

20A Peak load (resistive) for 50ms
Output voltage dips from 24V to 17V.

Fig. 24-2  Peak load with 5x the nominal current for 5ms, typ.

<table>
<thead>
<tr>
<th>Output Voltage</th>
<th>24V</th>
<th>15.5V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Current</td>
<td>30A</td>
<td>0A</td>
</tr>
</tbody>
</table>

50A Peak load (resistive) for 5ms
Output voltage dips from 24V to 15.5V.

High Overload Current (typ. 30A for 12ms) enables easy fuse tripping

Please note: The DC-OK relay triggers when the voltage dips more than 10% for longer than 1ms.

Peak current voltage dips

| Typ. | From 24V to 17V | At 20A for 50ms, resistive load |
| Typ. | From 24V to 19V | At 50A for 2ms, resistive load |
| Typ. | From 24V to 15.5V | At 50A for 5ms, resistive load |
24.2. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off.

The maximum allowed feed-back-voltage is 35Vdc. The maximum allowed feed-back peak current is 40A. Higher currents can temporarily shut-down the output voltage. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 6.

24.3. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 30A (UL) and 32A (IEC). An external protection is only required if the supplying branch has an ampacity greater than this. Check also local codes and local requirements. In some countries local regulations might apply.

If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 6A B- or C-Characteristic breaker should be used.

24.4. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB’s or UL 1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 24V branches.

MCB’s are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 24V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC’s. This requires power supplies with high current reserves and large output capacitors. Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the power supply does not help if Ohm’s law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross Chapter and wire length.

![Test Circuit Diagram]

Maximal wire length\(^1\) for a fast (magnetic) tripping:

</tbody>
</table>

\(*\) Don’t forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and – wire).
24.5. **SERIES OPERATION**

Do not use the power supply in series. The leakage current will be too high to meet the medical requirements.

24.6. **PARALLEL USE TO INCREASE OUTPUT POWER**

Do not use the power supply in parallel. The leakage current will be too high to meet the medical requirements.

24.7. **PARALLEL USE FOR REDUNDANCY**

Do not use the power supply in parallel. The leakage current will be too high to meet the medical requirements.

24.8. **INDUCTIVE AND CAPACITIVE LOADS**

The unit is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or “UltraCaps”) with a capacitance larger than 1.5F are connected to the output, the unit might charge the capacitor in the HiccupPLUS mode (see chapter 6).

24.9. **CHARGING OF BATTERIES**

The power supply can be used to charge lead-acid or maintenance free batteries (SLA or VRLA batteries). Two 12V batteries are needed in series.

**Instructions for charging batteries:**

a) Set output voltage (measured at no load and at the battery end of the cable) very precisely to the end-of-charge voltage.

<table>
<thead>
<tr>
<th>End-of-charge voltage</th>
<th>27.8V</th>
<th>27.5V</th>
<th>27.15V</th>
<th>26.8V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery temperature</td>
<td>10°C</td>
<td>20°C</td>
<td>30°C</td>
<td>40°C</td>
</tr>
</tbody>
</table>

b) Use a 15A or 16A circuit breaker (or blocking diode) between the power supply and the battery.

c) Ensure that the output current of the power supply is below the allowed charging current of the battery.

d) Use only matched batteries when putting 12V types in series.

e) Ensure that the ambient temperature of the power supply stays below 40°C.

f) The return current to the power supply (battery discharge current is typ. 3.5mA when the power supply is switched off (except in case a blocking diode is utilized).
24.10. OPERATION ON TWO PHASES

The power supply can also be used on two-phases of a three-phase-system. Such a phase-to-phase connection is allowed as long as the supplying voltage is below 240V\(^{+10\%}\).

24.11. USE IN A TIGHTLY SEALED ENCLOSURE

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply.

The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure.

The power supply is placed in the middle of the box, no other heat producing items are inside the box.

Input: 230Vac

Case A:
Enclosure: Rittal Typ IP66 Box PK 9519 100, plastic, 180x180x165mm
Load: 24V, 8A; (=80%) load is placed outside the box
Temperature inside the box: 42.0\(^{\circ}\)C (in the middle of the right side of the power supply with a distance of 1cm)
Temperature outside the box: 25.8\(^{\circ}\)C
Temperature rise: 16.2K

Case B:
Enclosure: Rittal Typ IP66 Box PK 9519 100, plastic, 180x180x165mm
Load: 24V, 10A; load is placed outside the box
Temperature inside the box: 48.1\(^{\circ}\)C (in the middle of the right side of the power supply with a distance of 1cm)
Temperature outside the box: 26.2\(^{\circ}\)C
Temperature rise: 21.9K

Case C:
Enclosure: Rittal Typ IP66 Box PK 9516 100, plastic, 110x180x165mm
Load: 24V, 8A; (=80%) load is placed outside the box
Temperature inside the box: 48.6\(^{\circ}\)C (in the middle of the right side of the power supply with a distance of 1cm)
Temperature outside the box: 26.3\(^{\circ}\)C
Temperature rise: 22.3K

Case D:
Enclosure: Rittal Typ IP66 Box PK 9519 100, plastic, 110x180x165mm
Load: 24V, 10A; load is placed outside the box
Temperature inside the box: 53.8\(^{\circ}\)C (in the middle of the right side of the power supply with a distance of 1cm)
Temperature outside the box: 26.6\(^{\circ}\)C
Temperature rise: 27.3K
24.12. MOUNTING ORIENTATIONS

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.

Curve A2 Max allowed output current (results in approximately half the lifetime expectancy of A1).

![Mounting Orientation A](image1)

![Mounting Orientation B](image2)

![Mounting Orientation C](image3)

![Mounting Orientation D](image4)

![Mounting Orientation E](image5)
