

24V, 20A, 480W, SINGLE PHASE

REDUNDANCY POWER SUPPLY

- AC 100-240V wide-range input
- Width only 48mm
- Built-in decoupling MOSFET for 1+1 and N+1 redundancy
- Efficiency up to 95.2%
- 20% output power reserves (PowerBoost)
- Safe Hiccup^{PLUS} overload mode
- Easy fuse breaking—3 times nominal current for 12ms
- Active Power Factor Correction (PFC)
- Minimal inrush current surge
- Full power between -40°C and +60°C
- DC-OK relay contact
- Current sharing feature included
- 3 year warranty

PRODUCT DESCRIPTION

The Dimension CP-Series are cost optimized power supplies without compromising quality, reliability and performance. The most outstanding features of the CP20.241–R1/-R2 units are the high efficiency, electronic inrush current limitation, active PFC, wide operational temperature range and the extraordinary small size. The units include a decoupling MOSFET for building 1+1 or N+1 redundant power supply systems. The devices also offer PowerBoost: Power reserves of 20%, which may even be used continuously at temperatures up to +45°C.

These redundancy power supplies come with three connection terminal options; screw terminals, spring-clamp terminals or plug connector terminals which allows replacement on an active application.

CP20.242-R2 version feature an enhanced DC input voltage range and the CP20.241-R2-C1 is additionally equipped with conformal coated pc-boards.

With high immunity to transients and power surges, low electromagnetic emission, a DC-OK signal contact for remote monitoring, and a large international approval package, makes this unit suitable for nearly every application.

SHORT-FORM DATA

TERMINOLOGY AND ABREVIATIONS

PE and symbol PE is the abbreviation for Protective Earth and has the same meaning as the symbol symbol at the same as the U.S. term "ground".

t.b.d. To be defined, value or description will follow later.

AC 230V A figure displayed with the AC or DC before the value represents a nominal voltage with

standard tolerances (usually ±15%) included.

E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)

230Vac A figure with the unit (Vac) at the end is a momentary figure without any additional

tolerances included.

50Hz vs. 60Hz As long as not otherwise stated, AC 230V parameters are valid at 50Hz mains frequency.

may A key word indicating flexibility of choice with no implied preference.

shall A key word indicating a mandatory requirement.

should A key word indicating flexibility of choice with a strongly preferred implementation.

1+1 Redundancy Use of two identical power supplies in parallel to provide continued operation following most

failures in a single power supply.

N+1 Redundancy Use of three or more identical power supplies in parallel to provide continued operation

following most failures in a single power supply. E.g.: To achieve a 80A redundant system, five 20A power supplies are needed in a

N+1 redundant system.

24V, 20A, 480W, SINGLE PHASE

1. INTENDED USE

This device is designed for installation in an enclosure and is intended for the general professional use such as in industrial control, office, communication, and instrumentation equipment.

Do not use this power supply in equipment, where malfunction may cause severe personal injury or threaten human

2. Installation Requirements

WARNING Risk of electrical shock, fire, personal injury or death.

- Do not use the power supply without proper grounding (Protective Earth). Use the terminal on the input block for earth connection and not one of the screws on the housing.
- Turn power off before working on the device. Protect against inadvertent re-powering.
- Make sure that the wiring is correct by following all local and national codes.
- Do not modify or repair the unit.
- Do not open the unit as high voltages are present inside.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

Obey the following installation requirements:

- This device may only be installed and put into operation by qualified personnel.
- Install the device in an enclosure providing protection against electrical, mechanical and fire hazards.
- The device is designed for use in pollution degree 2 areas in controlled environments.
- The enclosure of the device provides a degree of protection of IP20 according to IEC 60529.
- Mount the unit on a DIN rail so that the input terminals are located on the bottom of the unit. For other mounting orientations see derating requirements in this document.
- The device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid (e.g. cable conduits) by more than 15%!
- Keep the following installation clearances: 40mm on top, 20mm on the bottom, 5mm on the left and right sides are recommended when the device is loaded permanently with more than 50% of the rated power. Increase this clearance to 15mm in case the adjacent device is a heat source (Example: another power supply).
- Make sure that the wiring is correct by following all local and national codes. Use appropriate copper cables that are designed for a minimum operating temperature of 60°C for ambient temperatures up to +45°C, 75°C for ambient temperatures up to +60°C and 90°C for ambient temperatures up to +70°C. Ensure that all strands of a stranded wire enter the terminal connection. Check also local codes and local requirements. In some countries local regulations might apply.
- This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect. If damage or malfunction should occur during installation or operation, immediately turn power off and send the device to the factory for inspection.
- The device is designed, tested and approved for branch circuits up to up to 30A (UL) or 32A (IEC) without additional protection device. If an external fuse is utilized, do not use circuit breakers smaller than 10A B- or C-Characteristic to avoid a nuisance tripping of the circuit breaker.
- A disconnecting means shall be provided for the input of the power supply.

24V, 20A, 480W, SINGLE PHASE

Notes for use in hazardous location areas:

The power supply is suitable for use in Class I Division 2 Groups A, B, C, D locations. See chapter 20 for details.

WARNING EXPLOSION HAZARDS!

Substitution of components may impair suitability for this environment. Do not disconnect the unit or operate the voltage adjustment unless power has been switched off or the area is known to be non-hazardous.

Wiring must be in accordance with Class I, Division 2 wiring methods of the National Electrical Code, NFPA 70, and in accordance with other local or national codes.

A suitable enclosure must be provided for the end product which has a minimum protection of IP54 and fulfils the requirements of the EN 60079-0.

24V, 20A, 480W, SINGLE PHASE

3. AC-INPUT

The device is suitable to be supplied from TN-, TT- and IT mains networks with AC voltage. For suitable DC supply voltages see chapter 4.

4. DC-INPUT

The device is suitable to be supplied from a DC input voltage. Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit. Connect +pole to L, -pole to N and the PE terminal to an earth wire or to the machine ground.

5. INPUT INRUSH CURRENT

An active inrush limitation circuit limits the input inrush current after turn-on of the input voltage. The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

| | | AC 100V | AC 120V | AC 230V | |

| Inrush energy | Max. | 1A ² s | 1A ² s | 1A ² s | Temperature independent |

Fig. 5-1 Typical turn-on behavior at nominal load and 25°C ambient

24V, 20A, 480W, SINGLE PHASE

6. OUTPUT

The output provides a SELV/PELV/ES1 rated voltage, which is galvanically isolated from the input voltage. The output of the devices includes a decoupling MOSFET for building 1+1 or N+1 redundant power supply systems.

The device is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or "UltraCaps") with a capacitance > 1F are connected to the output, the unit might charge the capacitor in the Hiccup^{PLUS} mode.

The device is featured with a "soft output regulation characteristic" in order to achieve current share between multiple devices when they are connected in parallel. The "soft output regulation characteristic" regulates the output voltage in such a manner that the voltage at no load is approx. 4% higher than at nominal load.

| Output voltage | Nom. | DC 24V | 23.8 - 25.2V | |
|-------------------------------------|--------|--|---|--|
| Adjustment range | | See chapter 24.2 | | |
| Factory settings | | 24.1V | $\pm 0.2\%$, at 20A, cold unit (results to typ. 23.9V $^{\pm 0.2\%}$ at 24A and typ. 25.1V $^{\pm 0.2\%}$ at no load) | |
| Line regulation | Max. | 10mV | 85-300Vac | |
| Load regulation | Тур. | 1000mV | Static value, 0A → 20A; see Fig. 6-1 | |
| Ripple and noise voltage | Max. | 100mVpp | 20Hz to 20MHz, 50Ohm | |
| Output current | Nom. | 20A | Up to +60°C ambient temperature, see Fig. 17-1 | |
| | Nom. | 15A | At +70°C ambient temperature, see Fig. 17-1 | |
| | Derate | linearly between +60°C | C and +70°C, see chapter 17 | |
| PowerBoost ¹⁾ | Nom. | 24A | Up to +45°C ambient, see Fig. 17-1 | |
| | | werBoost decreases linearly to nominal power between +45°C and +60°C, see upter 17 | | |
| Fuse breaking current ²⁾ | Тур. | 60A | Up to 12ms once every five seconds, see Fig. 6-3. | |
| Overload protection | | Included | Electronically protected against overload, no-load and short-circuits. In case of a protection event, audible noise may occur. | |
| Overload behaviour | | Continuous current | Output voltage above 13Vdc, see Fig. 6-1 | |
| | | Intermitted current ³⁾ | Output voltage below 13Vdc, see Fig. 6-1 | |
| Overload/ short-circuit current | Max. | 29.8A | Continuous current, see Fig. 6-1 | |
| | Тур. | 29A | Intermitted current peak value for typ. 2s Load impedance 10mOhm, see Fig. 6-2. Discharge current of output capacitors is not included. | |
| | Max. | 9.8A | Intermitted current average value (R.M.S.) Load impedance 10mOhm, see Fig. 6-2 | |
| Output capacitance | Тур. | 8 000μF | Included inside the power supply | |
| Back-feeding loads | Max. | 35V | The unit is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off. The absorbing energy can be calculated according to the built-in large sized output capacitor. | |
| 1) Danier Daniet | | | | |

1) Power Boost

This power/ current is continuously allowed up to an ambient temperature of +45°C.

Above +45°C, do not use this power or current longer than a duty cycle of 10% and/ or not longer than 1 minute every 10 minutes.

²⁾ The fuse braking current is an enhanced transient current which helps to start heavy loads or to trip fuses on faulty output branches. The output voltage stays above 20V. See chapter 24.1 for additional measurements.

³⁾ At heavy overloads (when output voltage falls below 13V), the power supply delivers continuous output current for 2s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-2.

8. DC-OK RELAY CONTACT

This feature monitors the output voltage of the power supply in front of the decoupling device (see also chapter 12).

| Contact closes | As soon as the output voltage reaches typ. 22Vdc. |
|----------------------|---|
| Contact opens | As soon as the output voltage dips below 22Vdc. |
| | Short dips will be extended to a signal length of 100ms. Dips shorter than 1ms will be ignored. |
| Switching hysteresis | 1V |
| Contact ratings | Maximal 60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A, resistive load |
| | Minimal permissible load: 1mA at 5Vdc |
| Isolation voltage | See dielectric strength table in chapter 19. |

24V, 20A, 480W, SINGLE PHASE

10. LIFETIME EXPECTANCY

The Lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

| | AC 100V | AC 120V | AC 230V | |
|---------------------|----------------|----------------|----------------|------------------|
| Lifetime expectancy | 117 000h | 136 000h | 164 000h | At 10A and +40°C |
| | 331 000h | 386 000h | 465 000h | At 10A and +25°C |
| | 40 000h | 53 000h | 90 000h | At 20A and +40°C |
| | 114 000h | 150 000h | 253 000h | At 20A and +25°C |
| | 16 000h | 25 000h | 47 000h | At 24A and +40°C |
| | 44 000h | 69 000h | 134 000h | At 24A and +25°C |

11. MTBF

MTBF stands for **M**ean **T**ime **B**etween **F**ailures, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.

The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

For these types of units the MTTF (Mean Time To Failure) value is the same value as the MTBF value.

| | AC 100V | AC 120V | AC 230V | |
|--------------------------|----------------|----------------|----------|---|
| MTBF SN 29500, IEC 61709 | 387 000h | 412 000h | 543 000h | At 20A and +40°C |
| | 723 000h | 768 000h | 976 000h | At 20A and +25°C |
| MTBF MIL HDBK 217F | 164 000h | 169 000h | 199 000h | At 20A and +40°C; Ground Benign GB40 |
| | 224 000h | 231 000h | 272 000h | At 20A and +25°C; Ground Benign GB25 |
| | 34 000h | 36 000h | 42 000h | At 20A and +40°C; Ground Fixed GF40 |

Instructions for wiring:

- a) Use appropriate copper cables that are designed for minimum operating temperatures of: 60°C for ambient up to 45°C, 75°C for ambient up to 60°C and 90°C for ambient up to 70°C minimum.
- b) Follow national installation codes and installation regulations!
- c) Ensure that all strands of a stranded wire enter the terminal connection!
- d) Unused terminal compartments should be securely tightened.
- e) Ferrules are allowed and recommended.

24V, 20A, 480W, SINGLE PHASE

14. REPLACING UNITS WHILE THE SYSTEM IS RUNNING

This feature is available only for the CP20.241-R2, CP20.242-R2 and CP20.241-R2-C1 units, which are equipped with hot-swappable plug connectors.

Fig. 14-1 Replacing the power supply or redundancy module while the system is running + -Output 24V 20A + = Output 24V 20A DC-OK ⊗ DC-OK ⊗ 쭚V믊 SK- 시듬 CP20.241-R2 Power Supply CP20.241-R2 Power Supply (1b)

Replacement instructions (Example for left power supply):

- Switch-off circuit breaker (1a).
- Remove plug (2a).
- Remove plug (3a). The plug prevents the cables from shorting.
- Change power supply.
- Put the plug (3a) back in.
- Put the plug (2a) back in.
- Turn-on the circuit breaker (1a).
- The circuit is redundant again.

To replace the right power supply, repeat the process above using (1b), (2b) and (3b).

24V, 20A, 480W, SINGLE PHASE

19. DIELECTRIC STRENGTH

The output voltage is floating and has no ohmic connection to the ground. Type and routine tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

Fig. 19-1 Dielectric strength

| | | Α | В | C | D |
|------------------------------------|------|---------|---------|---------|--------|
| Type test | 60s | 2500Vac | 3000Vac | 1000Vac | 500Vac |
| Routine test | 5s | 2500Vac | 2500Vac | 500Vac | 500Vac |
| Field test | 5s | 2000Vac | 2000Vac | 500Vac | 500Vac |
| Cut-off current set for field test | ting | > 10mA | > 10mA | > 20mA | > 1mA |

It is recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the earth/ground system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

B*) When testing input to DC-OK ensure that the maximal voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.

24V, 20A, 480W, SINGLE PHASE

24. APPLICATION NOTES

24.1. PEAK CURRENT CAPABILITY

The unit can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents. This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady-state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of overcurrent to open in a timely manner. This avoids voltage loss in adjacent circuits.

The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the power supply. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following three examples show typical voltage dips for resistive loads:

Fig. 24-1 **40A peak current for 50ms, typ.** (2x the nominal current)

Fig. 24-3 60A peak current for 12ms, typ. (3x the nominal current)

Fig. 24-2 100A peak current for 5ms, typ. (5x the nominal current)

Please note: The DC-OK relay might triggers when the voltage dips below 22Vdc for longer than 1ms.

| Peak current voltage dips | typ. | from 24V to 16V | At 40A for 50ms, resistive load |
|---------------------------|------|-------------------|---------------------------------|
| | typ. | from 24V to 21V | At 100A for 2ms, resistive load |
| | typ. | from 24V to 16.5V | At 100A for 5ms, resistive load |

24V, 20A, 480W, SINGLE PHASE

24.2. Adjusting the Output Voltage

A voltage adjustment potentiometer can be found behind the flap on the front of the unit. However, it is not recommended to change the output voltage since load sharing between power supplies connected in parallel can only be achieved by a precise setting of the output voltages. The factory settings allow precise load sharing and only qualified personnel should change the adjustment potentiometer.

| Lower end of the speci | ified adjustmer | nt range | | |
|------------------------|-----------------|---|---|--|
| Output voltage | Nom. | 24.0V | Due to the soft output voltage regulation characteristic (parallel mode feature) a setting to 24.0V results to an output voltage of $23.8V^{\pm0.2\%}$ at 24A and $25.0V^{\pm0.2\%}$ at no load. See Fig. 24-4. | |
| Output current | Min. | 24A | At 45°C | |
| | Min. | 20A | At 60°C | |
| | Min. | 15A | At 70°C | |
| | | Reduce output current linearly between +45°C and +70°C. | | |
| Upper end of the speci | fied adjustmen | t range | | |
| Output voltage | Nom. | 28.0V | Due to the soft output voltage regulation characteristic (parallel mode feature) a setting to 28.0V results to an output voltage of $27.7V^{\pm0.2\%}$ at 20.6A and $29.2V^{\pm0.2\%}$ at no load. See Fig. 24-4. | |
| Output current | Min. | 20.6A | At 45°C | |
| | Min. | 17.1A | At 60°C | |
| | Min. | 13.0A | At 70°C | |
| | | Reduce o | output current linearly between +45°C and +70°C. | |

The maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances is 30V. It is not a guaranteed value which can be achieved. The typical value is 29.5V.

Current values between 24 and 28V can be interpolated.

Fig. 24-4 Adjustment range of the output

The output voltage shall only be changed when absolutely necessary, e.g. for battery charging as described in the next chapter.

24V, 20A, 480W, SINGLE PHASE

24.3. CHARGING OF BATTERIES

This redundancy power supply is ideal for charging batteries due to the decoupling circuit built in to the output stage which does not require a fuse or diode between the power supply and the battery.

It can be used to charge sealed lead acid (SLA) or valve regulated lead acid (VRLA) lead batteries when following these instructions:

a) Set output voltage (measured at disconnected battery) very precisely to the end-of-charge voltage. Use the potentiometer, which is hidden behind the flap on the front of the unit. See chapter 24.2.

| Battery temperature | 10°C | 20°C | 30°C | 40°C |
|-----------------------|-------|-------|--------|-------|
| End-of-charge voltage | 27.8V | 27.5V | 27.15V | 26.8V |

- b) Ensure that the ambient temperature of the power supply stays below 40°C.
- c) Use only matched batteries when connecting 12V types in series.
- d) The return current to the power supply (battery discharge current) is typically 11mA when the power supply is switched off.

24.4. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB's or UL 1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 24V branches.

MCB's are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 24V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC's. This requires power supplies with high current reserves and large output capacitors. Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the power supply does not help if Ohm's law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross section and wire length.

Fig. 24-5 Test circuit

Maximal wire length*) for a fast (magnetic) tripping:

| | 0.75mm ² | 1.0mm ² | 1.5mm ² | 2.5mm ² |
|-------|---------------------|--------------------|--------------------|--------------------|
| C-2A | 34m | 45m | 64m | 101m |
| C-3A | 27m | 36m | 52m | 79m |
| C-4A | 19m | 26m | 35m | 56m |
| C-6A | 9m | 12m | 16m | 23m |
| C-8A | 4m | 8m | 12m | 18m |
| C-10A | 4m | 6m | 9m | 15m |
| C-13A | 2m | 3m | 4m | 5m |
| B-6A | 23m | 30m | 38m | 67m |
| B-10A | 11m | 14m | 21m | 32m |
| B-13A | 7m | 12m | 17m | 23m |
| B-16A | 4m | 6m | 8m | 11m |
| B-20A | 1m | 1m | 2m | 4m |

^{*)} Don't forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and - wire).

24V, 20A, 480W, SINGLE PHASE

24.5. SERIES OPERATION

Power supplies of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc. Voltages with a potential above 60Vdc must be installed with a protection against touching.

Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other. Do not use power supplies in series in mounting orientations other than the standard mounting orientation (input terminals on bottom of the unit).

Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

24.6. Parallel Use to Increase Output Power

Power supplies can be paralleled to increase the output power. For redundancy applications one extra power supply is always needed for sufficient output current in case one unit fails.

The unit is permanently set to "parallel use" mode in order to achieve load sharing between power supplies connected in parallel. The "Parallel use" mode regulates the output voltage in such a manner that the voltage at no load is approx. 4% higher than at nominal load. See also chapter 6.

Energize all units at the same time. It also might be necessary to cycle the input power (turn-off for at least five seconds), if the output was in overload or short circuits and the required output current is higher than the current of one unit.

Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.

Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation (input terminals on bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude).

Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies. Do not load paralleled power supplies with higher currents as shown in the following diagrams:

Fig. 24-6 Output current vs. ambient temp. for two paralleled units

Fig. 24-7 **Output current vs. ambient temp.** for three paralleled units

Nov. 2025 / Rev. 1.3 DS-CP20.241-R2-EN - All parameters are typical values specified at 230Vac, 50Hz input voltage, 24V, 20A output load, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.

24V, 20A, 480W, SINGLE PHASE

24.7. PARALLEL USE FOR REDUNDANCY

Power supplies can be paralleled for redundancy to gain higher system availability. The unit is already equipped with a MOSFET as decoupling device on the output to avoid, that a faulty unit becomes a load for the other power supplies and the output voltage cannot be maintained any more.

Recommendations for building redundant power systems:

- Use separate input fuses for each power supply.
- Monitor the individual power supply units by utilizing the built-in DC-OK relay contacts on each power supply.

Fig. 24-9 Wiring diagram, N+1 Redundancy for 40A output current

24V, 20A, 480W, SINGLE PHASE

24.8. OPERATION ON TWO PHASES

The power supply can also be used on two-phases of a three-phase-system. Such a phase-to-phase connection is allowed as long as the supplying voltage is below $240V^{+10\%}$.

The maximum allowed voltage between a Phase and the PE must be below 300Vac.

24.9. Use in a Tightly Sealed Enclosure

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply.

The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure.

The power supply is placed in the middle of the box, no other heat producing items are inside the box

Enclosure: Rittal Typ IP66 Box PK 9519 100, plastic, 180x180x165mm

Load: 24V, 16A; (=80%) load is placed outside the box

Input: 230Vac

Temperature inside enclosure: 51.9°C (in the middle of the right side of the power supply with a distance of 2cm)

Temperature outside enclosure: 25.6°C Temperature rise: 25.3K

24V, 20A, 480W, SINGLE PHASE

24.10. Mounting Orientations

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.
Curve A2 Max allowed output current (results in

Max allowed output current (results in approximately half the lifetime expectancy of A1).
